**Application for Working Student Process Development for CDCC2.0 Baselayer Software**

Dear Recruiting Team,

Thank you for suggesting this opportunity after reviewing an earlier requirements-engineering application. After reading the Process Development posting, I am applying because it stays within the MB.OS Baselayer Integration environment while matching my strengths in structured documentation, process improvement, and cross-functional coordination.

Across previous digital-product and operations-heavy roles, I worked with engineers and business stakeholders to structure requirements and document workflows. The work required disciplined delivery and reliable follow-through in Jira, Confluence, and Scrum-based collaboration.

After receiving this job description, I read more about Automotive SPICE. Its focus on defined processes, traceable execution, and continuous improvement in automotive software development fits this working style. It clarifies responsibilities, documents repeatable ways of working, and improves processes from feedback.

Compared with the earlier requirements-engineering position, this process-development role is a stronger practical match. The role allows a contribution where process discipline, onboarding support, and agile teamwork matter while building deeper ASPICE context in the CDCC2.0 baselayer environment.

From 01 May 2026, I can work up to 20 hours per week. My German is still improving; I work confidently in English at C1 level and continue to strengthen my German. Thank you for considering this fictional demonstration.

Best regards,

FICTIONAL SAMPLE SIGNATURE
